

## Instructions

Your task is to add a simple page to the Web site for The Snow Board, a manufacturer of snowboards. The page you're adding is the company's Products page. You'll be doing this twice: once in Macromedia Dreamweaver and once in Mozilla's Composer.

You are restricted to the visual/design mode of each application, but you may use any menu, attribute, or control function each application provides in this mode. You may also use the program's help facility, if needed.

The following information identifies the location of relevant files and a number of page layout specifications needed to complete the task. Feel free to open the existing files (listed below) if this helps you to accomplish the task.

- All site files are located within the My Documents folder, in a subfolder (or working folder) named SnowBoard.
- The existing site pages in the SnowBoard folder are the company's "home" and "about us" pages: **index.htm** and **aboutus.htm**.
- The attached printout shows the completed Products page design. The file name for the new page you will create each time must be **products.htm**.
- Keep in mind the following page specification as you work on the new page. (And note that the following does not fully describe the page; refer to the attached design hardcopy for other requirements.)
  - The page background color is CCCCCC.
  - The page title is "The Snow Board -- Products" (without the quotes).
  - Page content should not exceed 800 pixels in width.
  - Product images should have a 1-pixel black border.
- The images you'll need for the Products page are in the site's working folder.

Finally, your completed page doesn't have to be a perfect match with the design, but you should attempt to match it as closely as possible.
